

Marine Epoxy

Hagmans Marine Epoxy is a 2-component spackle for marine use. It is used for gluing, spackling and repairing, even under the waterline, of boats, jet skis, surfboards and water skis, etc. Also works perfectly on other objects of fibreglass, wood, steel, aluminium, etc. It can be applied in thicker layers without risk of shrinking or cracking. The foundation must be clean and dry. When filling previously painted surfaces the surface must be grinded to a matt finish. Loose paint must be removed. Mixing: One part Compound A to one part Compound B. The components are mixed to a homogenous grey mixture. Application: Apply using a steel or rubber spatula. Usage time at 20°C is twenty minutes. The spackle can be smoothed out with a damp tool for up to 2 hours after application; can be grinded after approximately 24 hrs at +20 °C. Clean tools using Cellulosaförtunning (cellulose naphtha). **NB:** The lowest temperature for optimal curing is 5 °C. Pot life: Two years.
